target site, comprising a first (F1), a second (F2), and a third (F3) carget site, comprising a first (F1), a second (F2), and a third (F3) carget site, comprising a first (F1), a second (F2), and a third (S3) target subsite. Also described are: (1) a polypeptide (I1) comprising (I); (2) a polynucleotide (III) encoding (I) or (III); and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (M) (I) involves selecting the F1 zinc finger such that it comprises (M) (I) involves selecting the F2 zinc finger such that it chinds to the S1 target subsite, and selecting the F3 zinc finger such that it chinds to the S2 target subsite, thus designing (I) that binds to a target site (I) is useful for recognition of trippet target subsites (C) a target site (I) is useful for recognition of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant condulate the expression of a target ranger in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of danger sequences, as well as enhanced biological activity. ABG71213 to ABG72214 and ABP48191 to ABF51230 represent DNA target sequences and zinc invention.
                                                                                New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                       present invention describes a zinc finger protein (I) that binds to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                              The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) are transported tinger, ordered F1, F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypebtide (II) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites. (C a target site. (I) is useful for recognition of the subsite. (I) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in c diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. AB071213 to AB072214 and ABP48191 to ABP51230 represent DNA target sequences and zinc invention of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                   New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                        The invention relates to a method for haplotyping the cytochrome P450, cubdamily IID, polypeptide 6 (CYP2D6) gene (AB07215, AB072154) of an individual, and also describes 29 novel polymorphic sites within the individual, and also describes 29 novel polymorphic sites within the individual, and also describes 29 novel polymorphic sites within the human CYP2D6 gene. The CYP2D6 gene is located on chromosome 22q13.1 and contains 9 excess which encode a 497 amino acid protein (ABB05651). CYP2D6 is a mono-oxygenase involved in the detoxification of many drugs and cantiarrhythmics, adrenoreceptor antagonists and tricyclic antideressants, and is also involved in the formation of a metabolite cantideressants, and is also involved in the formation of a metabolite in CYP2D6 activity or expression may also influence an individual's susceptibility to environmentally-linked diseases, and it has been demonstrated that CYP2D6 activity may be involved in the abenomental or pathogenesis of Parkinson's disease, with individuals with a less active form of CYP2D6 activity or expression and crows been demonstrated that CYP2D6 activity may be involved in the carge to the treatment of CYP2D6 protein for use in screening drugs for the treatment of CYP2D6 activity may be involved in the effect.

CYP2D6 nucleic acid sequences are useful in studying the expression and drug-induced lugue syndrome) or which are metabolised by CYP2D6. CYP2D6 nucleic acids and proteins are also useful in studying the effect of myogenteeling and proteins are also useful in studying the effect of proper pathogen and proteins are also useful in studying the effect of proper pathogen and proteins are also useful in studying the effect of proper pathogen and proteins are also useful for haplotyping coligonucleotide primers of suggetion and proteins are also useful in early incompanies, and to control for genetically primers congrision at the earget or are metabolised by CYP2D6. The proper pathogen in populations and in individuals, employing the earget or are metab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The SAGE tags of this invention consist of a sequence of 10 mucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in Thi and/or Th2 cells, antibodies against these proteins, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inhibitors of the expression of groups of genes that are expressed in either or both the two cell types. Groups of genes expressed in Thi and/or Th2 cell types may be used for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags representing 171 genes which are more highly expressed in Th1 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chemokine binding protein 2; CCBP2; CCBP2 protein isoform; gene therapy; polymorphic gene variant; single nucleotide polymorphism; human; primer;
activated T cell; T lymphocyte; immune response; expression pattern; preferential expression; immune disorder; EST; expressed sequence tag;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human activated Th1 and Th2 cell expression gene group, useful for the diagnosis and treatment of Th1 and Th2-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Matches RESULT 37 ADA63306 8 셤 The invention relates to an isolated polymucleotide comprising genes and haplotypes of the Chep2 gene are useful in studying the expression and cunction of CCBP2 and in expressing CCBP2 proteins for use in screening candidate drugs for treating diseases associated with CCBP2 activity. Polymucleotides comprising a polymorphic gene variant or fragment may be seed for therapeutic purposes, where a patient could benefit from expression or increased expression of a patient could benefit from expression or increased expression of a patient could benefit from expression or increased expression of a patient could benefit from expression or increased expression of a patient could benefit from cutout of several steps in drug discovery and development process, including target validation, identifying lead compounds, and early phase including target validation, identifying lead compounds, and early phase colling trials. The polymucleotides of the invention can be used to treat disorders related to the CCBP2 gene by gene therapy. This could be processed to the invention can be used to be processed to the invention can be used to the invention can be used to the invention can be used to be compounded to the invention can be used to the compound can be used to the invention can be used to the compound can be used t ö New genetic variants having polymorphisms in the chemokine binding protein 2 (CCBP2) gene, useful for studying CCBP2 functions, and for treating disorders affected by expression or function of the CCBP2 Gaps . 0 50.0%; Score 8; DB 1; Length 10; 100.0%; Pred. Nucleic acid PCR amplification method-related RAPD PCR primer #153. Nucleic acid amplification; nucleic acid analysis; BNA analysis; BNA analysis; RNA analysis; RAPD; PCR; primer; random amplified polymorphic DNA.

28-MAR-2002; 2002WO-GB001489

Amplification of nucleotide sequences from polynucleotides by chain extension of oligonucleotide primers, comprises 2 oligonucleotides in

F

```
The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded DNA molecules, double-stranded DNA molecules and mRNA molecules. The present DNA sequence represents a random amplified polymorphic DNA (RAPD)
                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
solution, 2 attached to supports and both share complementary sequences.

                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                     Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.

Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                       ö
                                                                                                                              Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                      The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.

The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1, F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3 to 5 direction, first (S1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for recognising triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1. The zinc finger proteins can be used for recognising triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  zinc finger protein; triplet target subsite; zinc finger motif; sp-1; ds.

The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1, F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3' to 5' direction, first (S1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for recognising triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                   zinc finger protein; triplet target subsite; zinc finger motif; sp-1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New zinc finger protein used for recognizing triplet target subsites having nucleotide G in 5'-most position of subsite, that has been optimized with respect to location of subsite within target site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Light responsive element; frq gene; LRE; imperfect repeat; ds; WC-1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1, F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3' to 5' direction, first (S1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for recognising triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                                                                                                                                                                                                                                         zinc finger protein; triplet target subsite; zinc finger motif; sp-1; ds.
                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New zinc finger protein used for recognizing triplet target subsites having nucleotide G in 5'-most position of subsite, that has been optimized with respect to location of subsite within target site.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to regulating expression of a gene in a cell comprising contacting a cell containing flavin adenine dinucleotide (FAD) and a gene operatively-linked to a light-responsive regulatory sequence with a white collar (WC)-1/WC-2 transactivator that binds FAD and the light-responsive regulatory sequence. Also included are a light-responsive regulatory sequence (or light responsive element, LRE) appearing as ADJ65133, ADJ65134, ADJ65135, and ADJ65136 (LREs from the N. crassa frg gene promoter) and a kit comprising a WC-1/WC-2 transactivator and a light-responsive regulatory sequence. The method and kit are useful for regulating gene expression using light. The present sequence is an LRE (comprising an imperfect repeat) from the Neurospora crassa frg gene promoter which binds the WC-1/WC-2 transactivators.
                                                                                                                                                                                                                                                                                                                                           Regulating expression of a gene in a cell comprises contacting a cell containing FAD and a gene operatively linked to a light-responsive regulatory sequence with a WC-1/WC-2 transactivator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.

Example 2; SEQ ID NO 739; 149pp; English.

The invention relates to a method of diagnosis (MI) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                          ö
specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of diagnosis (MI) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukines, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                          Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                        The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                           Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

capable of altering the biological activity of a protein encoded by a mucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         method involves contacting the compound with a cell having a first and second polynucleotide encoding fusion protein of first and second first and second engineered zinc finger protein (ZFD) targeted to a first and second endogenous cellular gene and measuring expression of the first and second endogenous genes. The invention is useful for screening a compound for its specificity, toxicity or metabolic properties by utilising a cell e.g., mammalian cell and for screening a compound utilised as agonist or antagonist of human hormone receptor. The present sequence is human annexins, AnxA8 binding site oligonucleotide. This sequence is used in the multiplex screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of screening a compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           50.0%; Score 8; DB 1; Length 10; 100.0%; Pred.   The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-coding tegions and all
codons, genomic flanking regions, intron-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5120-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
cutte asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cutte asthma, allergies, asthma, impeded respiration, respiratory
distress constriction, emphysema, chronic obstructive pulmonary
cutte aster (CODD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, mich may metastasize or have metastasized
                                                                                           pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma; allergy, asthma; impeded respiration, respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction, emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense oligonucleotides used in treatment of, e.g. pulmonary

99WO-US017712. 98US-0095212P. The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets concleted acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antialial antial ergics, antialiary the treatment of diseases associated with filammation. The ON can have antialial ergics, antialiary conclusion in the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating cet. impaired airways, including lung diseases and diseases whose secondary impeded respiration, respiratory distress syndrome, pain, altergies, asthma, impeded respiration, respiratory distress such as leukaemias, lumphomas, or pulmonary hypertension, emphysema, chronic obstructive fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the cronic as side effects. The A-containing ONS break down with the concentration and inflammation. AAA3313 to AAA35312 represent the invention, which correspond to SEQ ID NO:1 to 185, but the sequences differ correspond to SEQ ID NO:1 to 185, but the sequences differ corresponding SEQ ID NO:1 to 185, but the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. could be advanced by the corresponding SEQ ID NO: sequences given in the disclosure of the present invention. N.B. including the content of the present invention. N.B. including the sequences given in the disclosure of the present invention. N.B. including the sequences given in the disclosure of the present invention. N.B. including the sequences given in the disclosure of the present invention. listing

The antiense oligonucleotides and ballgnancy associated proteins. The antiense oligonucleotides and believe the system of the system of the system of anticon and peripheral nervous and non-nervous system completed in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers
                                                                                                                                                                                                                                                                                                                                                                                                                     respiratory obstruction, pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinfilammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchtis, and/or cancer. AAF16434 to AAF21543 represent human polymuclectide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                           Human endothelial nitric oxide synthase polynucleotide fragment #1908.
                                                                                                                                                                                                                                                                                                    Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; alrway disorder; bronchoconestriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression. ($AGE$) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(MI) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, soleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carrinoma or sarcoma of the EST) of the invention

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or pronotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriaais; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antisense; lung dysfunction, nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation cooding regain, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of increasing levels of thighinone or increasing levels of thighinone or increasing levels of the control of the control or increasing levels or control or increasing levels of the control or control or increasing levels of the control or c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating control of a target polypeptide adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung carrier and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a conference of a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiratory disease, pulmonary control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                                                                                                                                                                                                                                                                    This invention describes a novel in vitro method for identifying genes
that are significant for facial skin in humans. The method comprises
that are significant for facial skin in humans. The method comprises
cc tracovering, from facial skin, a first mixture of genetically expressed
ct transcribed and optionally translated) factors (i.e. proteins, mRNA or
their fragments), recovering a second, similar mixture from some other
breast and subjecting the mixtures to serial analysis of gene expression
cc facts) to identify those genes for which expression is markedly different
between facial skin and the other tissue. The invention also describes an
cc between facial skin and the other tissue. The invention also describes an
cc in vitro method for determining homeostasis of human facial skin; a test
ckit which comprises a solid support (flexible or rigid) on which are
cimmobilised probes that bind specifically to the factors of interest and
a biochip for determining homeostasis of human facial skin. The products
cc the invention are also used in a method which determines activity of
ccosmetic and pharmaceutical agents for use against disorders or
cc disturbances of the homeostasis of human skin and a screening method for
identifying cosmetic and pharmaceutical agents. The method allows
cidentifying cosmetic and pharmaceutical spenes important for facial
skin and thus of a very wide range of potential therapeutic and cosmetic
agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to
cc identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody panning; random peptide library; ligand screening; dynorphin B;

Complementary oligonucleotides ON-335 and ON-336 (AAQ71038 and AAQ71039) replaced a Sfil-HindIII dynorphin B fragment of pMC3 (see AAQ71036-7). A random doceamer peptide library was constructed by replacing the ON-335/336 insert by oligonucleotides ON-332, -370 and -369 (AAQ71040-2, respectively). ON-370 and ON-369 annealed to ON-332 to produce Sfil and HindIII-compatible ends but the ligated product does not have either arcognition sequence. The random peptide library was panned with an antibody specific for dynorphin B and peptides were identified which possessed homology to the dynorphin B epitope. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        dynorphin B; random peptide library; construction; monoclonal antibody; D32.39; epitope; screening; pM3; pMC5; primer; PCR; ss.
                                                                                                                                                                                        Construction of random peptide library - by creating vectors contg. DN encoding the random peptide(s) fused to BNA binding proteins; used to screen for novel ligands.

Winizibozyme dimers of the formula (I/II) are also claimed and have a two-part binding region for target RNA and L and M are base-paired to form a stem structure. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                              A random peptide (RP) library can be constructed by transforming host cells with a collection of recombinant vectors that encode a fusion protein comprised of a DNA binding protein (BP) and a RP and also contains a binding site for the DNA BP. The RP library can be used to screen for novel ligands, the method resulting in the formation of complex comprising the fusion protein bound to a receptor through the RP ligand and to the recombinant DNA vector through the DNA BP. ANII4737, encoding a random dodecamer peptide, was synthesised and purified by HPLC and phosphorylated with T4 kinase. Two half-site oligonucleotides (AATI4737 to produce Sfil and HindIII-compatible ends, resp., but the ligated product does not have either recognition sequence. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAS02731-AAS02909 represent human pregnane X receptor (hpXR) coding sequences and PCR primers of the invention. The human pregnane X receptor sequences are used to make antibodies, or a substance capable of binding specifically to the gene product of hPXR gene, for diagnosing and treating various diseases, such as cancer, with drugs that are substrates, inhibitors or modulators of the hPXR gene product. The proteins can be used to identify and obtain prodrugs and drugs for treatment of diseases which are amenable to chemotherapy. The nucleic acids can be used in gene therapy for the treatment or prevention of disorders associated with hPXR expression
mini-ribozymes and the dimer they form can be used for cleavage and inactivation of RNA. They are also useful as agents for treatment or diagnosis of a genetic disease. The present sequence was disclosed in the sequence ID listing of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel variant of the human pregnane X receptor gene, associated with insufficient metabolization and/or sensitivity to drugs, is useful for diagnosing and treating diseases with drugs that are modulators of their gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                               In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST; expressed sequence tag, 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AASO2731-AASO2909 represent human pregnane X receptor (hPXR) coding sequences and PCR primers of the invention. The human pregnane X receptor sequences are used to make antibodies, or a substance capable of binding specifically to the gene product of hPXR gene, for diagnosing and treating various diseases, such as cancer, with drugs that are substrates, inhibitors or modulators of the hPXR gene product. The proteins can be used to identify and obtain prodrugs and drugs for treatment of diseases which are amenable to chemotherapy. The nucleic acids can be used in gene therapy for the treatment or prevention of disorders associated with hPXR expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel variant of the human pregnane X receptor gene, associated with insufficient metabolization and/or sensitivity to drugs, is useful for diagnosing and treating diseases with drugs that are modulators of their gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                             The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (GAGE) so as to identify skin-expressed genes and quantify their expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
(MI) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintenins or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
                                                                                                              ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The invention relates to a nucleic acid enzyme with modifiable RNA cleavage activity. More specifically the invention relates to a nucleic acid enzyme, trans maxizyme, which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule. The enzyme of the invention is useful for cleaving target RNA and is useful in treating diseases caused by the target RNA. This polynucleotide sequence represents the heterodimeric maxizyme RNA substrate relating to the maxizyme enzyme of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erychematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

The invention relates to a process for making a genetically engineered Neisserial strain (preferably Neisseria meningitidis serogroup B) in which the lippoligosaccharide (LOS) immunotype is fixed or locked. A feature of the meningococcal LOS is the reversible, high frequency switching of expression (phase variation) of terminal LOS structures, which is an obstacle to the development of a cross-protective vaccine based on the use of LOS as the antigen. The process of the invention involves engineering a Neisserial strain such that the homopolymeric nucleotide tract of a phase variable LOS synthesis gene (specifically GFA or ligid) is reduced in length (whilst maintening the open reading frame), resulting in gene expression which is less phase variable. The method of the invention can be used to produce a Neisserial strain with a liked L2 or L3 immunotype, which can be used in the manufacture of vaccines (particularly multivalent vaccines) against neisserial disease, especially meningococcal disease. The present sequence represents the disrupted polyc tract of the constitutively expressed Neisseria
mutant; lgtG; disrupted polyC tract; fixed; constitutive expression; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Jennings MP, Poolman J;

This invention describes a novel in vitro method for identifying genes
that are significant for hair-bearing skin in humans. The method
comprises recovering, from hair-bearing skin in first mixture of
genetically expressed (transcribed and optionally translated) factors
(1.e. proteins, mRNA or their fragments), recovering a second, similar
mixtures from skin on which hair does not grow and subjecting both
mixtures to serial analysis of gene expression (SAGS) to identify those
genes for which expression is markedly different between the two types of
skin. The invention also describes in vitro methods for determining
homeostasis of human hair-bearing skin and for determining activity of
cosmetic and pharmaceutical agents for use against disorders or
disturbances of the homeostasis of human hair-bearing skin. A biochip and
the method probes are also described for determining homeostasis. The
hair-bearing skin is from the scalp and the other skin is from the face.
The method allows identification of as many as possible of the genes
important for hair-bearing skin, and therefore of a very wide range of
cotential therapeutic and cosmetic agents. ADQ35184-ADQ36518 represent
human DNA Tag fragments used to identify genes associated with hair-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin, a first mixture of comprises recovering, from hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixtures from skin on which hair does not grow and subjecting both mixtures to serial analysis of gene expression (SAGS) to identify those genes for which expression is markedly different between the two types of homeostasis of human hair-bearing skin and for determining activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. A biochip and a test kit comprising solid support (flaxible or rigid) with immobilised probes are also described for determining necessions in mixturbances are also described for determining necessions. The method allows identification of as many as possible of the genes immobilised probes are also described for determining homeostasis. The hair-bearing skin is from the scalp and the other skin is from the face. The method allows identification of as many as possible of the genes important for hair-bearing skin, and therefore, of a very wide range of potential therapeutic and cosmetic agents. This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises that are significant for facial skin in humans. The method comprises contenting, from facials skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other content from the state of the mixtures to serial analysis of gene expression of present and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin; a test of in vitro method for determining homeostasis of human facial skin; a test of mimobilised probes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or destruction of as many as possible of the genes important for facial contential therapeutic and cosmetic content and chus of a very wide range of potential therapeutic and cosmetic content and chus of a very wide range of potential therapeutic and cosmetic contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; haplotype mapping; SNP detection; tumor; cytostatic; neoplasm; immune disorder; cardiovascular disease; metabolic disorder; respiratory disease; musculoskeletal disease; renal disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                      gene polymorphism in drug-related genes such as aryl acetylamide deacetylase, arytalkylamine N-acetyl transferase or ATP-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing haplotype. The method is useful for estimating the sensitivity or disease of a medicine or a foreign material, for selecting medicine for preventing or treating disease, for determining appropriate dosage of medicine for preventing or treating of treating adjeases, for datermining appropriate dosage of medicine for preventing or treating of its analyzing a drug ensitivity of the medicine, foreign material or disease. The diseases include malignant tumor, immune disorder circulatory disease, metabolic disease, kidney disease, respiratory disease and muscle associated disease. The method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence
                                                                                                                                                                                                                                                                                      Analyzing haplotype, by detecting polymorphism in drug-related genes, electing common polymorphism (CP), building haplotype block using CP, specifying CP within block, specifying tag polymorphism from CP within block.
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of analyzing haplotype, by detecting

Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine AI receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the Gransmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine AI receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Yeast, Saccharomyces cerevisiae, transcriptome, cell cycle, regulation, eukaryotic cell; antifungal, SAGE tag; gene expression; serial analysis of gene expression; probe; ss.

Transcriptome is encoded by a DNA molecule comprising a yeast gene involved in cell cycle progression selected from the group of connannotated ORF (NORF) genes. SAGE (serial analysis gene expression) tags for highly expressed genes and NORF genes are given in AAVS0051 to AAVS0345. The present invention describes: (1) a method of using yeast genes to modulate the cell cycle which comprises administering to a cell genes to modulate the cell cycle which comprises administering to a cell an isolated DNA molecule comprising a yeast gene which is involved in cell cycle progression selected from differentially expressed genes (SAGE tags given in AAVS0051 to AAVS0345); (2) a method for screening candidate cell and monitoring expression of a yeast gene which is involved in cell cycle progression of a yeast gene which is involved in cell cycle progression which comprises hybridizing a probe comprising at least 10 contiguous nucleotides of a yeast gene which is differentially expressed between at least 2 phases selected from the log phase, the S phase and the GZ/M phase; and (4) a probe for ascertaining the phase in the cell cycle, where the probe comprises at least 14 contiguous nucleotides of a NORF gene (SAGE tags given in AAVS0051 to AAVS0345), or as an array of probes on a solid support
                                                                                                                                                                                                                                                                                                                                                               Yeast transcriptome - useful for modulating eukaryotic cell, for screening antifungal agents, and for identifying genes in cell cycle progression.

                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparising genomic DNA from tumour cells and genomic DNA (cf) xR2, where R is a purine selected from adenine and year in a nucleotide sequence (CG)xR2, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xR3, where R is as in (i) and x = 3-7, (iii) a nucleotide sequence (CG)xR3, where R is as in (i) and x = 3-7, (iv) a cutosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG)xR3, where R is a purine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xR3, where R is a purine selected from denine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xR3, where R is a purine selected from denine and quanine and x = 6-16, (vii) a nucleotide sequence (CA)xR3, where R is a purine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xR3, where R is a purine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xR3, where R is a purine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xR3, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic content and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; cardiovascular disease; atherosclerosis; ischaemia; restenosis; reperfusion; hypertension; arterial inflammation; diagnosis; rchd528;

The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
                                                                                                                                                                                                                                                                     of cardiovascular diseases, including: atherosclerosis; ischaemia; restenosis; reperfusion; hypertension; and arterial inflammation. The present sequence represents a primer used in an example from the present
                                                                                                                                                                The present invention describes rchd528 protein. A method has been developed for producing the rchd528 gene product. The present invention also describes methods and compositions for the treatment and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; altergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense oligonucleotides used in treatment of, e.g. pulmonary

eend and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AXX55272-74. These multiple target oligonucleotides diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases und conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstration, inflammation, respiratory allordome, pain, cytic fibrosis, pulmonary hypertension, pulmonary hypertension, pulmonary vasoconstration, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancer, pa

codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5527-74. These multiple target oligonucleotides (specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory diseases syndrome, pain, cystic fibrosis, pulmonary hypertension, cultimass constructive pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a rchd502 target/fingerprint gene encoding a transmembrane protein. The invention provides cDNAs contained in plasmids pFCHD5028F (ATCC 69981) and pFCHD502SJ (ATCC 69982) that encode the rchd502 polypeptide, and are differentially expressed in cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fingerprinting gene; rchd502; transmembrane protein; cardiovascular; fingerprint/target gene; up-regulated; endothelial cell; shear-stress; atherosclerosis; ischemia; reperfusion; hypertension; restenosis; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotides consisting of residues 1-1929 of the rchd502 gene are differentially expressed in cardiovascular disease states, and can therefore be used to treat and diagnose cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

disease states. Cultured genetically engineered host cell containing the rech6502 polymucleotides in operative association with a nucleotide regulatory element are used for producing a polypeptide rch6502 gene product. Identifying that the fingerprint/target gene rch6502 is differentially expressed (up-regulated) by endothelial cells subjected to shear-stress, provides a tool for the diagnosis and treatment of cardiovascular disease e.g. atherosole-rosis, ischemia/reperfusion, hypertension, restenosis. The fingerprint gene is useful for testing the efficacy of candidate drugs in basic research and in clinical trials and or imaging of a diseased cardiovascular tissue. The gene may also be used in screening for ligands of target gene product receptor domains, as well as antagonists of the ligand-receptor interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a human forkhead transcription factor gene, FKHL7. The FKHL7 protein can be produced by standard recombinant methodology. The products can be used for diagnosis, prognosis, monitoring, prevention and treatment of glaucoma. They can also be used for the production of transgenic animals and drug screening. Sequences AAZ38076.78 represent fragments of the FKHL7 gene, which when deleted or when mutations occur in this region, may cause or contribute to the development of glaucoma

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets onclide acids involved in bronchoconstriction, allergies, and/or antisathmatic. cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the conclocutes side effects. The A-containing ONs break down with the conclocute sequences given in the sequence listing from the present to release of decyadenosine which activates adenosine receptors causing conclocution sequences given in the sequence listing from the present to release are also called SEQ ID NO:1 to 185, but the sequences of from the previously named sequences SEQ ID NO:1 to 185, but the sequences of from the previously named sequences SEQ ID NO:1 to 185, but the sequences of sequences given in the disclosure of the present invention. With their corresponding SEQ ID NO: sequences given in the disclosure of the present invention and with their corresponding SEQ ID NO: sequences given in the sequence given in the disclosure of the present invention and interpretating the present invention and interpretating the present invention and interpretating from the present invention and interpretation of the present invention and the disclosure of the present invention and interpretating the pres

In present invention describes a new composition composition targets

Inflammation. The ON can have antiinflammatory, antialergic, and/or

Inflammation. The ON can have antiinflammatory, antialergic, and/or

antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation.

Cuseful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating of e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cypulmonary disease (COPD), and cancers sund as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and cancers which may metastasise to the lungs, including carcinomas, and cancers which may metastasis active demosine content of the ONB reduces side effects. The A-containing ONS break down with the concern side effects which activates adenosine receptors causing conclosuration and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID No:1 to 2815, and then the last 185 sequences are also called SEQ ID No:1 to 185, but the sequences differ

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofector proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed equence tags) which were previously unknown to be conferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells, immunostimulatory cofectors also being required for insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofectors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen APC; and as hybridisation probes/amplification primers for the diagnosis and monitoring of diseases related to abnormal companies of these genes. Detection of the dendritic cell differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the cypressed genes, or of their encoded proteins, can be used to identify expressed genes or of their encoded proteins, can be used in active immunotherapy (or to stimulate production of a cypoulation of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and containing them are used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   presentation to endogenous ÅPCs and upregulates the APCs for the presentation of co-efficientiatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; moncoyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AAZTY573-ZY9109 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or BSTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while contex transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other cytotoxic immune response, particularly against tumour cells. Thuour antigen presentation by 1-cell receptors is alone activation of the cytotoxic immune response, particularly against tumour cells. Immunostimulatory cofactors also being required for ceflicient to activate a robust cytotoxic immune response that can lyse insufficient to activate a robust cytotoxic immune response that can lyse cefficient activation of cytotoxic 1-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expression of these genes. Detection of the dendritic cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a cells as belonging to the monocyte lineage. Cells containing these genes containing can be used in active immunotherapy (etcls) and vectors containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                          SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AAZ7573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding cimmunostimalatory cofactor proteals which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previoually unknown to be correspond to novel genes. Antigen-presenting cell corporation of the cytocoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is allone complex) and subsequent recognition by T-cell receptors is allone complex) and subsequent recognition by T-cell receptors is allone complex, and subsequent recognition by T-cell receptors is allone complex, and subsequent recognition by T-cell receptors is allone complex, and subsequent recognition by T-cell receptors is allone complex, and subsequent recognition by T-cell receptors is allone complex, and subsequent recognition of cyctoxic immune response that can lyse chieficient activation of cyctoxic T-lymphocytes (TTLS). Nucleic call cefficient activation of cyctoxic T-lymphocytes (TTLS). Nucleic call cefficient activation of cyctoxic T-lymphocytes (TTLS). Nucleic call of conditions and subvidisation probes/ amplification primers for the appressed genes in the sequences identify the sequences of disgnosis and monitoring of diseases related to abnormal complex progressed genes, or of their encoded proteins, can be used to identify expressed genes, or of their encoded proteins, can be used to active immunotherapy (or to stimulate production of antigen specific effector cells) and vectors containing them are used in gene therapy. Cells containing these genes containing the active immunotherapy (or to stimulate production of constimulatory factors enaures adequate antigen presentation of antigen specific effector cells) and vectors containing presentation of cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells. AAZ86972 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ86577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and creatment of breast cancer, particularly where metastatic Diagnosis is compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribosymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (AA). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immunotherapy
                                                                             Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                       Novel isolated rchd502 polypeptides, differentially expressed in response to endothelial cell shear stress, used for diagnosis, monitoring clinical trails, and treating cardiovascular diseases such as ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                            This oligonucleotide was used as forward primer, with the reverse primer given in AAA88555, in a differential display analysis of interleukin-1 activated HUVEC. mRNA prepared from control HUVEC and from HUVEC treated for 1 or 6 hr with 10 U/ml 11-1 was subjected to analysis. The novel human gene rchd005 (see AAA88580) was identified, which is up-regulated in IL-1 activated HUVEC. rchd005 is 1 of 8 novel human genes of the invention (see AAA88560) was about the spense of the invention (see AAA885683) contacts as a point differentially expressed in cardiovascular disease states, and which are of diagnostic

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences). particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific to antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter functional and isolate populations of educated, antigen-specific immune effecter functional function

AAZB0767 to AAZB3941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZB3942 to AAZB6677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). AAZB6677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and creamment of breast cancer, particularly amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcribts are used to direct expression, in selected cell types, of cell thanscribts are used to direct expression, in selected cell types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific cantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive

that are preferentially transcribed in the metastatic breast tumour cells.

that are preferentially transcribed in the metastatic breast tumour cells. AAZ89342

to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts are meduated immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences)

continually an antigen-encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (AA). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

AAZ83942 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour citissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds that modulate encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter in immune effecter in immune effecter in immune in immune in immune in immune in immune immun

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcribts are used to direct expression, in selected cell types, of c.g. therapeutic genes (also ribosymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific crantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agenties. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, cells, cells, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that are preferentially transcribed in the metastatic breast tumour cells. that are preferentially transcribed in the metastatic breast tumour cells. that are the pregulated in metastatic breast tumour cells. AZ283942 to AZ286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells. These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breat cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds that antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; Polypeptides encoded by the transcripts are also useful in antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                      AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                             AA280767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences). Particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. calls, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

The present invention describes a group of genes consisting of 100 genes which are highly expressed in human dendritic cells; a group of genes which are expressed at a higher frequency in human dendritic cells than in human monocytes; and a group of genes which are expressed at lower frequency in human dendritic cells than in human monocytes. Bach group of genes are characterised in that cDNAs of these genes respectively have the base sequences of SEQ ID NO:10 to 100 (AAC73914 to AAC74013), SEQ ID NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114 to AAC74213), each is continuous with the base sequence 5'-CATG-3' located most closely to the poly-A region. The sequences can be used for the investigation of the role and mechanism of the involvement of diseases in which dendritic cells play a significant role, e.g. cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Groups of genes expressed in human dendritic cells at a greater or lesser extent than in monocytes for investigation and diagnosis of autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gapa
